Equilux

Pay, proven equal.
No salary revealed.

Equilux proves a company's gender pay-gap report came from its complete, real payroll, so staff, works councils and regulators can check it, without anyone seeing a single salary.

`equilux-lac.vercel.app` `Built on Midnight` `github.com/AustinChris1/Equilux`

THE PROBLEM

A pay-gap report that nobody can check.

Self-declared

The company does its own sums and publishes a number. Everyone else has to take its word for it.

Unverifiable

Checking the number would mean looking at every salary, which nobody should see.

Easy to bend

Leave a few people out, nudge a figure, or just get it wrong, and nobody outside can tell.

> "Our pay gap is 0%." Today there is no way to check that without opening the payroll.

— WHY NOW

From 7 June 2027 the report is EU law.

250+

WORKERS: EVERY YEAR

150–249

EVERY THREE YEARS · 100–149 FROM 2031

~53,000

EU BUSINESSES WITH 250+ STAFF

> Seven figures, every employer in scope. A category gap of 5% or more triggers a joint pay assessment, and in a dispute the employer must prove it did not discriminate.

DIRECTIVE (EU) 2023/970 · EUROSTAT 2023

— THE SOLUTION

Prove the report. Keep every salary sealed.

WITHOUT EQUILUX	WITH EQUILUX
The company says "our gap is 4%"	**The company proves "our gap is 4%"**
You trust the spreadsheet	**Anyone checks the proof in seconds**
Leaving someone out goes unnoticed	**The report must cover every payroll row, or it is refused**
Staff can't tell if they were counted	**Each employee checks their own record, once**
Whoever checks sees the salaries	**No salary is ever published or shared**

HOW IT WORKS

Five people, five keys, one proof.

01

Payroll provider seals the payroll

Every row becomes a sealed code. Salaries stay with payroll.

02

Works council checks it

Opens each sealed row against the real payroll and approves.

03

Each employee confirms

A record must match its row. An inflated salary matches nothing.

04

Employer proves the figures

All seven legal figures, checked inside the contract, 16 people at a time.

05

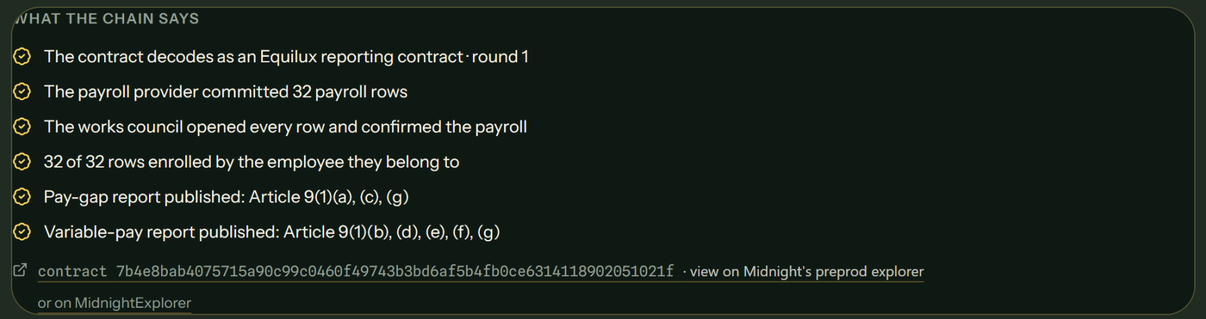

Anyone verifies

Read the report from the chain. Employees check their own record.

Small groups stay private: if a group has fewer than 3 women or 3 men, its pay is not shown, so nobody can work out a colleague's salary.

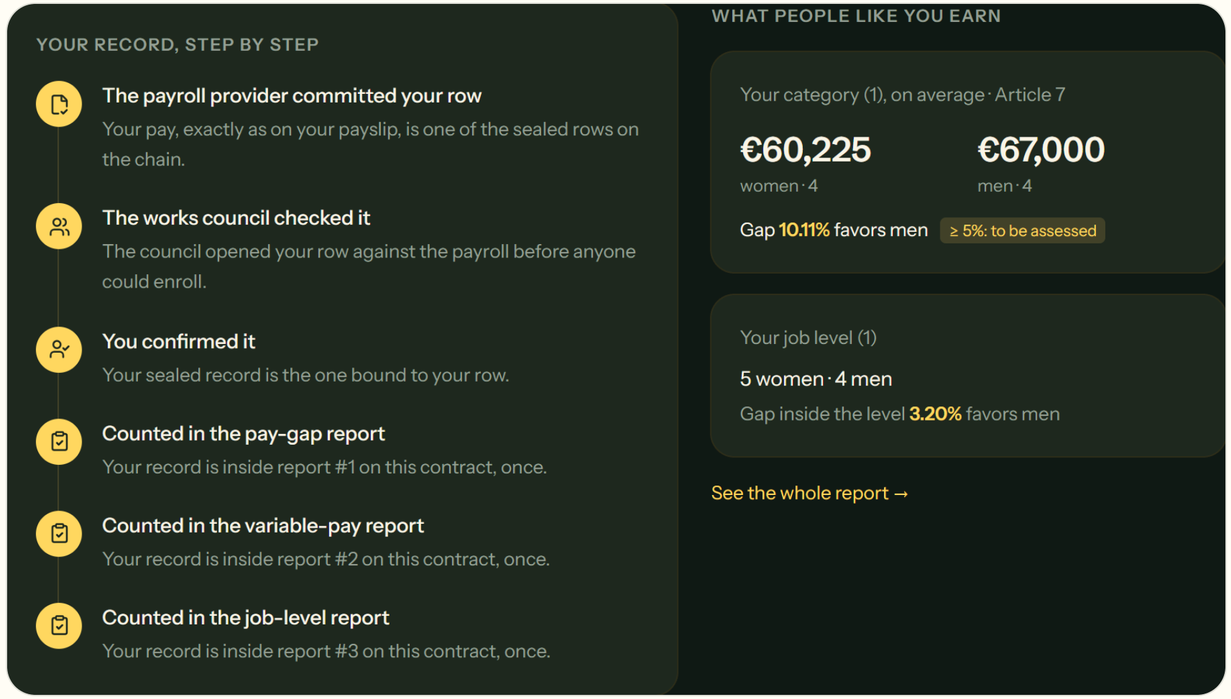

— IT WORKS TODAY

A real report on Midnight's public testnet.

- A 32-person company: **58 transactions**, every figure proven
- Average gap **9.50%**, middle gap **3.40%**, gap inside job levels **9.05%**
- Any company **up to 512 people**, proven 16 at a time; tested at 250
- Every cheat refused in the contract's own words
- **0 salaries** on chain

Check your own record from your payslip. No wallet.

- My row was sealed, the council checked it, I was counted **once in each report**
- What women and men in **my group** earn (the employee's right under Article 7)
- Nothing leaves the page. Change the salary by €100: **no row matches**

WHO IT'S FOR

Everyone who has to trust the report.

PAYS

Employers

A report staff, regulators and courts can check, from the payroll export they already have.

RESELLS

Payroll & HR software

They already make the report. Equilux adds proof it covers the whole payroll.

CHECKS

Works councils

Open every payroll row before the report goes out, without seeing names.

CHECKS

Employees

See they were counted, and what their group earns.

VERIFIES

Regulators

Read the proven figures from the chain instead of asking for the payroll.

CERTIFIES

Fair-pay certifiers

Back a certificate with figures proven to come from the full payroll.

Per employee, per year, through the tools employers already use.

Who pays

The employer: the legal duty is theirs. Reached through payroll and pay-transparency software that resells Equilux as a feature.

Why per employee

The work grows with headcount: about one transaction per person (346 for a 250-person company).

Why it sells

Analysis tools (Syndio, Trusaic, Figures) can't make the report checkable without showing salaries. Equilux sits beside them.

> No price is set yet: the first pilots will tell us what it has to cost to be worth it.

— WHY MIDNIGHT

Private data, public proof, on the same network.

Private inputs

Salaries, genders and job levels are private inputs on each person's device. They never reach the chain.

Proven outputs

Midnight checks a zero-knowledge proof for every step. Only the proven figures, sealed codes and anonymous marks become public.

Anyone can verify

The public record is open: regulators, staff and journalists read the same proven figures, with no account and no data request.

Written in Compact, Midnight's language for private contracts: 14 circuits, 73 tests, every disclosure explicit.

Equilux

WHERE WE ARE · WHAT WE ASK

Live and working. Looking for the first pilots.

Today

Live product, up to 512 people per report, proven on Midnight's testnet. No customers yet.

We ask

Employers and works councils for a free pilot; payroll and HR software companies for a partner conversation.
